## Contents

### 1 Exercise 2.1

In the first exercise we calculated the trajectory of a canonball in the air, without air resistance. The task was to test this with a couple of different initial masses. The results are shown in the following diagram:

Figure 1: Trajectory of a canonball with different masses

## 2 Exercise 2.2

Here we created the diagram with various friction and wind settings. We used the following settings: first without friction and wind, then without wind but with friction and last with friction and wind speeds of -30m/s. The results are shown in the following diagram:

Figure 2: Trajectory of a canonball with different friction and wind settings

The wind speed for which the canonball reaches the starting point is roughly  $v_{wind} = -195m/s$ .

## 3 Exercise 3.1

In the third exercise we calculated the trajectory of various particles with gravitational forces. The plot of the trajectories is shown in the following diagram:

The difference in timestep size between 0.001 and 0.0001 are shown in the resting frame of the moon and earth. The results are shown in the following diagram:

The part using the most time in the simulation is the calculation of the forces between the particles. Since there are two nested loops, the time complexity is  $O(n^2)$ . This could be reduced by using smart saving of results, but still would consume the most time in this code.

## 4 Exercise 3.2

We start with the Taylor expansion of  $x(t + \Delta t)$ :

$$x(t + \Delta t) = x(t) + v(t)\Delta t + \frac{1}{2}a(t)\Delta t^2 + O(\Delta t^3) \quad (1)$$

Figure 3: Trajectory of various particles with gravitational forces

Figure 4: Trajectory of particles with different timestep sizes

That is the position update of the Verlet algorithm.

For the velocity Verlet algorithm we need to expand  $v(t + \Delta t)$ :

$$v(t + \Delta t) = v(t) + a(t)\Delta t + \frac{1}{2} \frac{d^2v(t)}{dt^2} \Delta t^2 + O(\Delta t^3) \quad (2)$$

We now need to expand  $\frac{d^2v(t)}{dt^2}$  to the first order:

$$\frac{d^2v(t)}{dt^2} = \frac{d}{dt}a(t) = \frac{a(t + \Delta t) - a(t)}{\Delta t} + O(\Delta t) \quad (3)$$

Combined this results in the velocity Verlet algorithm:

$$x(t + \Delta t) = x(t) + v(t)\Delta t + \frac{1}{2}a(t)\Delta t^2 \quad (4)$$

$$v(t + \Delta t) = v(t) + \frac{1}{2}(a(t) + a(t + \Delta t))\Delta t \quad (5)$$

Now we rearrange the velocity Verlet algorithm to show that it is equivalent to the standard Verlet algorithm:

$$x(t + \Delta t) = x(t) + v(t)\Delta t + \frac{1}{2}a(t)\Delta t^2 \quad (6)$$

$$v(t + \Delta t) = v(t) + \frac{1}{2}(a(t) + a(t + \Delta t))\Delta t \quad (7)$$

We can now express  $a(t + \Delta t)$  using the Verlet algorithm:

$$a(t + \Delta t) = \frac{f(x(t + \Delta t))}{m} \quad (8)$$

$$= \frac{f(x(t) + v(t)\Delta t + \frac{1}{2}a(t)\Delta t^2)}{m} \quad (9)$$

$$= \frac{f(x(t)) + f'(x(t))v(t)\Delta t + \frac{1}{2}f''(x(t))a(t)\Delta t^2}{m} + O(\Delta t^3) \quad (10)$$

We can now plug this into the velocity Verlet algorithm:

$$x(t + \Delta t) = x(t) + v(t)\Delta t + \frac{1}{2}a(t)\Delta t^2 \quad (11)$$

$$v(t + \Delta t) = v(t) + \frac{1}{2}(a(t) + \frac{f(x(t)) + f'(x(t))v(t)\Delta t + \frac{1}{2}f''(x(t))a(t)\Delta t^2}{m})\Delta t \quad (12)$$

We can now rearrange the terms to show that the velocity Verlet algorithm is equivalent to the standard Verlet algorithm:

The difficulty of the velocity Verlet algorithm is that we need to calculate the force at the new position  $x(t + \Delta t)$ , which is not known yet. This makes it hard to update the position and velocity at the same time, since we need to calculate the force at the new position.

The different algorithms are compared in the following diagram, where we simulated the trajectory of all particles for one year at a timestep of 0.01 and showed moon in the resting frame of the earth.

Figure 5: Trajectory of particles with different integrators

## 5 Exercise 3.3

The results of the different integrators are shown in the following diagram, where we simulated the trajectory of all particles for one year at a timestep of 0.01 and showed the distance from earth to the moon over time. The expected results is no change in distance, since the particles are in a stable orbit.

Figure 6: Distance from earth to moon over time
